003
Card shuffle

Have you ever marveled at the dexterity of dealers shuffling cards? Good news: JavaScript can help us achieve the same effect! In this example, we'll make cards appear one by one from the bottom of the screen, move them to the center, and fan them out. Are you a casino enthusiast? You're in the right place.

HTML Structure

The structure here is fairly simple. Each card will be positioned at the edge of a large `circle`. These circles will rotate to create the fan effect. They'll be contained within a `container` div, which will remain pinned throughout the height of the `pin-height` div.

```
<div class="pin-height">
    <div class="container">
        <div class="circles">
            <div class="circle">
                <div class="card">...</div>
```

BATCH 001 — 050 EFFECTS

```
">...</div>
            <div class="circle">
                <div class="card">...</div>
            </div>
            ...
        </div>
    </div>
</div>
```

Some CSS

Our `pin-height` div will determine the height during which our `container` div stays pinned while scrolling. I chose a height of `500vh` for the scrollable distance so the effect plays out completely. If I reduce this value, the cards will appear faster because there will be less distance to scroll.

```
.mwg_effect003 .pin-height {
    height: 500vh;
}
```

The `container` will take the size of the viewport, while the circles will be much larger than the screen. The larger they are, the smaller the angle of the fan curve.

```
.mwg_effect003 .circle {
    width: 250vw;
    height: 250vw;
    border-radius: 100%;
    position: absolute;
    top :50%; // The top of the circle is positioned in the center of the screen
    left: 50%;
    transform: translate(-50%,0);
    will-change: transform; // Optimizes performance
}
```

Finally, we position each `card` within its `circle`.

```
.mwg_effect003 .card {
    ...
```

BATCH 001 — 050 EFFECTS

COPY/PASTE TO WEBFLOW AVAILABLE SEE HOW EASY IT IS

```
    transform: translate(-50%, 50vh); // 50vh on the y-axis so the card is right below t
    will-change: transform; // Optimizes performance
}
```

Calculating the initial angle

To start, I decided that the cards will be spaced 3 degrees apart, which will be applied to the `circle` divs.

```
let angle = 3
```

Then, I calculate the initial angle for the first `circle` based on the total number of cards.

```
const circles = document.querySelectorAll('.circle')

// Calculate half of the fan range
let halfRange = (circles.length - 1) * angle / 2
let rot = -halfRange
```

The initial `rot` value corresponds to the angle applied to the first circle.

Making the cards appear

A quick math exercise: first, I divide the scrollable distance by the number of cards so that each tween begins as soon as the previous one finishes.

```
const pinHeight = document.querySelector('.mwg_effect003 .pin-height')
const distPerCard = (pinHeight.clientHeight - window.innerHeight) / circles.leng
```

BATCH 001 — 050 EFFECTS

Made With Gsap

t, it's already visible over a y we subtract a value equal to `window.innerHeight` here.

To apply different values to each circle, I use the native JavaScript `forEach()` function:

```
circles.forEach( (circle, index) => {
    ...
})
```

To make the `card` move from the bottom of the screen to the correct position in the fan, I animate both its position and the rotation of its parent `circle` simultaneously. I use two `gsap.to()` methods in combination with the `ScrollTrigger` object. This object allows us to define when to trigger the animation.

```
circles.forEach( (circle, index) => {
    gsap.to(circle, {
        rotation: rot, // The circle starts at 0° and ends at the `rot` value
        ease: 'power1.out',
        scrollTrigger: {
            trigger: pinHeight, // Monitor the position of pin-height
            // Animation starts at distPerCard * the index of the card
            start: 'top top-=' + (distPerCard) * index,
            // And lasts exactly for distPerCard
            end: '+=' + (distPerCard),
            scrub: true // Progress linked to scrolling
        }
    })
    gsap.to(circle.querySelector('.card'), {
        // Optional: Apply 'rot' to the card to enhance the rotation effect
        rotation: rot,
        y: '-50%', // Positions the card in the center of the viewport
        ease: 'power1.out',
        scrollTrigger: {
            trigger: pinHeight, // Monitor the position of pin-height
            // Animation starts at distPerCard * the index of the card
            start: 'top top-=' + (distPerCard) * index,
            // And lasts exactly for distPerCard
            end: '+=' + (distPerCard),
            scrub: true // Progress linked to scrolling
        }
    })

    rot += angle
})
```

BATCH 001 — 050 EFFECTS

on, the value of `rot` is

Made With Gsap

.e to correctly position the next `circle`.

Pinning the container

The animation is complete, but we still need to pin the `circles` div for the duration of the animation. We'll also add a slight parallax effect, moving the `circles` div up and down for a smoother final result. I use the `gsap.fromTo()` method to define a start and end value:

```
gsap.fromTo('.mwg_effect003 .circles', {
    y: '5%' // The `circles` div starts at 5% of its height on the y-axis
}, {
    y: '-5%', // And ends at -5% of its height on the y-axis
    ease: 'none',
    scrollTrigger: {
        trigger: pinHeight, // Monitor the position of pin-height
        start: 'top top',
        end: 'bottom bottom',
        pin: '.mwg_effect003 .container', // Pin the container in place
        scrub: true // Progress linked to scrolling
    }
})
```

Go further

For a hand with more cards, it can be useful to reduce the `angle` value. For a faster or smoother motion, you could experiment with a different `easing` function, such as something other than `ease: power1.out`, which slightly slows down at the end.

In this example, I used the Lenis smooth scroll to further enhance the fluidity and sliding effect. If you'd like to implement it as well, visit our Go Further page to learn how to easily add it.
