Made With Gsap

007
Rounded trajectory

In this effect, we will scroll images as if they were following a rounded trajectory. In reality, each image will be positioned at the edge of a large division that extends beyond the viewport. We'll simply rotate this division to create the desired effect. Ready to roll up your sleeves? Let's go!

HTML Structure

The container will remain pinned while the user scrolls through the entire height of the `pin-height` division. Each image will be a child of a `circle` division, which will rotate.

```
<div class="pin-height">
    <div class="container">
        <div class="circle">
            <img class="media" src="./assets/medias/1.png" alt="">
        </div>
        <div class="circle">
            <img class="media" src="./assets/medias/2.png" alt="">
```

```

Some CSS

Our `pin-height` division will define the height over which the container remains pinned during scrolling. I chose a value of `400vh` for the scrollable distance, ensuring the entire effect plays out. If I reduce this value, the images will scroll faster since there will be less distance to cover.

```
.mwg_effect007 .pin-height {
    height: 400vh;
}
.mwg_effect007 .container {
    height: 100vh;
    overflow: hidden; // Hides anything exceeding the container
}
```

The `circle` divisions extend beyond the container and are horizontally centered. The top of each division is positioned at 50% of the `container` 's height.

```
.mwg_effect007 .circle {
    width: 300%;
    aspect-ratio: 1;
    position: absolute;
    top: 50%;
    left: -100%;
}
```

I then position each image at the center and top of its parent.

```
.mwg_effect007 .media {
    ...
    position: absolute;
    top: 0;
    left: 50%;
    transform: translate(-50%,-50%);
}
```

Pinning the container

On the JavaScript side, I pin the `container` division over the entire height of `pin-height` using a `ScrollTrigger.create()` instance. This instance also specifies when the container should be pinned.

```
const root = document.querySelector('.mwg_effect007')
const pinHeight = root.querySelector('.pin-height')
const container = root.querySelector('.container')

ScrollTrigger.create({
    trigger: pinHeight, // Listening to pin-height
    start: 'top top',
    end: 'bottom bottom',
    pin: container // The pinned section
})
```

To explain the code above: when the `pin-height` division reaches the top of the viewport, the `container` is pinned until `pin-height` exits the bottom of the viewport. This keeps the `container` perfectly visible in the viewport throughout this distance.

Moving the Images

Now, we simply move the images during the same duration that the `container` remains pinned. For this, I use the `gsap.fromTo()` method, which lets you define both the starting and ending values for an animation. Each `circle` will start at an angle of 30 degrees and rotate until it reaches an angle of -30 degrees.

```
const circles = root.querySelectorAll('.circle')

gsap.fromTo(circles, {
    rotation: 30 // Starting angle
},{
    rotation: -30, // Ending angle
    ease: 'power2.inOut', // Non-linear movement
    stagger: 0.06, // Delay between the start of each circle
    scrollTrigger:{
        trigger: pinHeight, // Listening to pinHeight
```

BATCH 001 — 050 EFFECTS

```

Made With Gsap                   progresses with scrolling
    ,
})
```

Notice the use of the `stagger: 0.06` property. But why `0.06` ? The key here is to know that the default value of the `duration` property is `0.5` for each tween. Therefore, if each element animates for 0.5 seconds and I stagger their start times by 0.5 seconds, they'll be perfectly sequenced. When we set `scrub: true` on a `ScrollTrigger` animation, it stretches or compresses the animation to fit perfectly between the start and end scroll positions.

Thus, if we set `stagger` to `0.5` here (since `duration` is `0.5`), one `circle` would rotate precisely as the previous one finishes its movement. Reducing this value allows multiple `circle` divisions to overlap their rotations simultaneously.

Go further

We could enhance the feeling of a single motion for all the images by setting `ease: none` instead of `ease: 'power2.inOut'` . This way, each image would rotate at the same speed, without acceleration or deceleration at the start and end of the movement.

In this example, I used the Lenis smooth scroll to further enhance the fluidity and sliding effect. If you'd like to implement it as well, visit our Go Further page to learn how to easily add it.

Final code

HTML CSS JAVASCRIPT

```html
<section class="mwg_effect007">
    <p class="scroll">Scroll</p>
    <div class="pin-height">
        <div class="container">
            <p class="header">Discover our favorite dishes of the week</p>
            <div class="circle">
